

1. **Identify the problem.** The first step is to identify the problem. This involves understanding the symptoms and the context in which they are occurring.

2. **Define the problem.** Once the problem is identified, it needs to be defined in terms of its scope and impact. This helps to clarify what is being addressed.

3. **Generate hypotheses.** Next, several hypotheses are generated to explain the problem. These are based on the information gathered in the first two steps.

4. **Test the hypotheses.** Each hypothesis is then tested through observation or experimentation. This step is crucial for determining which hypothesis is most likely correct.

5. **Accept the solution.** Once a hypothesis is confirmed, the solution is accepted. This involves implementing the solution and monitoring its effectiveness.

6. **Evaluate the solution.** Finally, the solution is evaluated to see if it has successfully resolved the problem. This step ensures that the problem has been fully addressed.
